

Project Old Spice

Freshness Protocols for Compromised Minds.

June 6, 2025

Empowering high-value individuals to remain operational—even when ideologically compromised.

The Core Problem

The Fragile Interface Between Loyalty and Leakage.

- High-clearance individuals regularly engage in unsanctioned digital communication across unsecured platforms.
- Intentional and unintentional data disclosures are increasing in frequency and sophistication.
- Traditional surveillance methods are reactive, not preventative.
- Individuals with ideological dissent may still provide high operational value.
- Current systems require binary choices: trust or termination.
 - We don't have a personnel problem—we have a containment gap.

Why Now?

The Escalating Threat Landscape Demands Preemptive Containment

- Increased **digital leakage events** originating from ideologically unstable insiders. (e.g., Teixeira Discord Leak, Snowden residuals, other cases not yet public)
- Rise of **Al-assisted content sharing** makes it easier to exfiltrate classified data undetected. Even loyal personnel are vulnerable to manipulated intent.
- Geopolitical volatility and decentralized media amplify the **impact of small disclosures**.

 One message = one international incident.
- Traditional vetting & clearance are insufficient in a **dynamic digital ecosystem**.

 Mental states shift faster than bureaucracies.
- Technological readiness: **LLMs**, **behavioral modeling**, **and live message filtration** now make real-time containment feasible. We have the tools. Waiting is the risk.

Our adversaries weaponize information. We must safeguard our own—with precision, not paranoia.

Operational Overview: Project Old Spice

Project Old Spice: Discreet Containment for High-Risk Loyalty Drift

Project Old Spice is a covert behavioral filtration and message intervention framework designed to preserve operational integrity among ideologically unstable, high-clearance individuals—without disrupting workflow, morale, or awareness.

Key Functions:

- Real-Time Communication Moderation
 Calls, messages, and emails are scanned, interpreted, and rerouted or rewritten using live AI intervention when necessary.
- Undetectable Perception Management
 Subjects remain unaware of content alterations, preserving self-agency and productivity.
- Behavioral Risk Profiling (BRP)
 Each individual is assessed, assigned a loyalty risk index, and monitored for dissident ideation or leak potential.
- Containment Bubble Layer
 All digital outputs are filtered through a secure, synthetic layer ensuring national alignment before public exposure.
- Al-Based Surrogate Interaction System
 When necessary, subjects are redirected to highly realistic Al agents to vent, confess, or self-regulate.

Deployment Strategy

Seamless Integration. Silent Containment. Scalable Control.

- Phase I: Internal Pilot
- → Phase II: Active Containment
- Phase III: Expansion

- ◆ 100 flagged personnel
- ◆ Enable live filtering and redirection
- Passive monitoring only
- Deploy to sensitive departments
- ◆ Refine AI prediction model
- Measure behavioral shifts
 - **Technical Highlights:**

- → Phase IV: Insider Threat Sync
 - Merge with CI/Cyber Ops protocols
 - ◆ Trigger escalations if filters fail

- Kernel-level lightweight agent
- No user awareness
- All data air-gapped + audit-logged

- Full deployment across
 ExtraVerify™ profiles
- Platform-wide integration (Slack, Signal, Discord, etc.)

What they don't know can't destabilize the country.

Risk Matrix

LOYALTY VS. OPERATIONAL VALUE
